Anesthetic Procedures & Risks

We use a combination of pre-anesthetic medications/injectable and/or inhalant anesthetics to achieve optimum levels of anesthesia that are safe for your pet.

For short procedure, an injectable anesthetic is given alone that produces a good plane surgical anesthesia with a quick recovery.

For most procedures, your pet is anesthetized and then intubated (insertion of a tube into the trachea or wind pipe). This will ensure that your pet is always able to receive oxygen and prevents aspiration of any fluids into the lungs.

For procedures that require minimum sedation, an injectable anesthetic is given that produces a good plane of sedation with quick recovery. Aesthesia is maintained with a gas anesthetic, ISO which is very safe and is not metabolized by the body. This allows us to have more control over the anesthetic depth and it is less irritating to the air ways. Another Advantage to ISO is a quick induction using a mask verses using injectable anesthetics that require metabolism from the body.

Monitoring & Pain Management- Monitoring of patients during anesthesia is done in two ways. First, a veterinary technician with your pet continuously from the beginning of anesthesia to recovery. Second, we have a computerized monitor that records heart rate, blood pressure, oxygen levels, respiration, ECG, core and rectal temperature.

Our clinic strongly believes in compassionate, quality, medical care for our patients. As a result, all surgery patient will receive pain management before, during and after surgery. Additionally, pain medication may be prescribed home. Additional information will be given t discharge. We hope this program will reduce any discomfort experienced and aid in a quicker recovery.

Intravenous Catheterization & Fluids

We highly recommend the placement of an IV catheter and use of IV fluids during all anesthetic procedure. This allows us to have quick, available access to the circulatory system (blood) in case of an unforeseen emergency. The fluids help provide support to the circulatory system and prevent dehydration, as well as aid in a quicker recovery from anesthesia.

Potential Surgical Complications

1. **Canine and Feline Spay**-Bleeding, Infection, Recurrent Heat, Urinary Incontinence Weight Gain, Suture Reaction.
2. **Canine and Feline Alter**-Bleeding, Infection, Suture Reaction (canine only).
3. **Feline Declaw**- Bleeding, Infection, Lameness/limping, Regrowth of nail.
4. **Tumor/Lump removal**- Bleeding, Infection, Swelling and Drainage, Suture Reaction

It is important for you to understand that there is always a risk of anesthetic and surgical complications anytime these procedures are performed. We strive to take the highest quality care of your pet and take all the added precautions you allow to avoid potential problems. Thank You for entrusting your pet to us.
